Profile

Senior applied AI engineer and technical lead with 10+ years building data-intensive software, machine-learning systems, and document automation, including seven years delivering production AI for enterprise insurance, finance, and legal workflows. Combines hands-on Python engineering and model lifecycle ownership with the ability to turn operational problems into maintainable products. Recent work spans LLM applications, agents, retrieval, evaluation, and self-correcting automation. PhD in Computer Science from KU Leuven; Dutch native and English C2.

Selected Impact

Production AI: At Instabase, designed and shipped a document agent that improved accuracy from 94% to 100% and straight-through processing from 30% to 100% on a defined enterprise dataset; raised accuracy from 85% to 92%+ on a separate dataset.

Client solutions: In client conversations, translated specific feature requests into technical plans and product capabilities for a leading European reinsurer, a Fortune 50 US company, and major banks. Benchmarking consultation supported a Munich Re deal; production debugging resolved a Fannie Mae issue.

End-to-end delivery: Built and maintained document classification and information-extraction pipelines for a SaaS product across insurance, finance, and legal use cases at Contract.fit.

Technical leadership: Led small, high-agency teams; mentored engineers and supervised 11 Master's thesis internships; co-authored successful applications for four VLAIO innovation grants.

Experience

Probably Approximately Human BV

Belgium / Remote

Independent AI Consultant

Present

- Design practical AI roadmaps and solutions, connecting organizational needs to prototypes and production delivery.
- Build generative AI prototypes, agentic automation, and document-processing workflows; provide technical assessment and advice.

Instabase

Remote

Senior Software Engineer, Machine Learning

2024–September 2026

- Designed and shipped DocumentReActAgent, an agentic feedback loop that revisits difficult document cases to improve prediction quality and automation coverage.
- Owned InstaLLM, an on-premises LLM solution, and built supervised fine-tuning and post-training workflows for adapting models to enterprise needs.
- Built distributed LLM training and fine-tuning pipelines for multi-GPU workloads using PyTorch FSDP and DeepSpeed.
- Built evaluation and benchmarking across model providers, with common structured outputs, model-assisted judging, and confidence analysis to support model selection and release decisions.
- Authored the Unified Extractor v2 architecture proposal, separating schemas, state, prompts, model engines, orchestration, and evaluation into modular components.
- Technical lead for the Agent Mode team; mentored engineers across three teams and delivered prototypes that became integral parts of the product roadmap.

Experience (continued)

Contract.fit (A Netcall Company)

Belgium

Artificial Intelligence / NLP Engineer

June 2017–March 2024

- Led applied AI engineering for document classification and information extraction in enterprise insurance, finance, and legal workflows.
- Worked directly with enterprise clients to understand their document workflows and specific feature requests, then translated those requirements into product capabilities and implementation plans.
- Built, deployed, maintained, and improved production ML pipelines within a SaaS product, translating customer and operational requirements into software.
- Applied NLP, computer vision, and uncertainty estimation to complex document data; brought advances in document understanding into product features.
- Co-authored four successful VLAIO innovation grant applications and supervised 11 Master's AI/CS thesis internships at KU Leuven and VUB.

Oracle & Nuance Communications

Barcelona, Spain / Aachen, Germany

Research Intern

2016–2017

Applied NLP research in sequence-to-sequence dialogue systems and recurrent language modelling.

Core Capabilities

Applied AI: Predictive and classification models; NLP and computer vision; LLM and vision-language applications; intelligent document processing; information extraction; RAG and semantic search.

Automation: AI agents and workflow orchestration; process automation; structured outputs; self-correction; human review and confidence-aware workflows.

Model lifecycle: Problem framing; data and task definition; training and model adaptation; evaluation and benchmarking; model selection; production deployment; validation and iteration.

Reliable data products: Data cleaning and quality checks; schema validation; dataset and model evaluation; confidence estimation; monitoring and risk-aware automation.

Engineering: Python, SQL, PyTorch, Hugging Face, scikit-learn, FastAPI, Pydantic, LangChain, LangGraph, Docker, MLflow; OpenAI, Anthropic, and Gemini APIs.

Technical leadership: Stakeholder discovery; translating business requirements into product and architecture plans; technical documentation; cross-functional collaboration; team mentorship.

Education & Research

KU Leuven

Belgium

PhD, Engineering Sciences (Computer Science)

2020–2024

Thesis: Intelligent Automation for AI-driven Document Understanding.

KU Leuven

Belgium

MSc, Artificial Intelligence

2015–2017

Speech & Language Technology; Magna Cum Laude.

KU Leuven

Belgium

MA, Linguistics

2014–2015

Corpus & Usage-based Methodologies; Magna Cum Laude.

Applied research: Created the DUDE document-understanding benchmark (ICCV 2023) and evaluation harness. Published research on document AI, machine-learning evaluation, and predictive uncertainty.
